Generate GRCh37 refcoding bed

Nate Olson 2020-02-20

1 Summary

Generating a functional GRCh37 region stratification bed files for use in variant benchmarking.

2 Loading packages and defining variables

3 Extracting CDS from RefSeq GFF

3.1 Getting Chromosome Assessions

Using feature table to extract chromosome assessions. Feature table downloaded from ftp://ftp.ncbi.nlm.nih. gov/genomes/refseq/vertebrate_mammalian/Homo_sapiens/all_assembly_versions/GCF_00001405.25_ GRCh37.p13/GCF_000001405.25_GRCh37.p13_feature_table.txt.gz.

```
ftbl_md5 <- "c0587443810e3d62da505fb653c28dd3"

ftbl_file <- "GCF_000001405.25_GRCh37.p13_feature_table.txt.gz"

if (!file.exists(ftbl_file)) {
    download.file(url = ftbl_path, destfile = ftbl_file)

    ## MD5 check
    dwn_md5 <- tools::md5sum(ftbl_file)

if(ftbl_md5 != dwn_md5) {
    warning("MD5 for downloaded feature table does not match expected MD5")
    }
}

## defining column types and names</pre>
```

3.2 Downloading and Parsing GFF File

Extracting RefSeq CDS from GFF file. GFF file downloaded from ftp://ftp.ncbi.nlm.nih.gov/genomes/refseq/vertebrate_mammalian/Homo_sapiens/all_assembly_versions/GCF_000001405.25_GRCh37.p13/GCF_000001405.25_GRCh37.p13_genomic.gff.gz.

```
gff_md5 <- "e84f4e0102b6c4f4cc0035b8abf1038f"
gff_file <- "GCF_000001405.25_GRCh37.p13_genomic.gff.gz"
if (!file.exists(gff_file)) {
  download.file(url = gff_path, destfile = gff_file)
  ## MD5 check
 dwn_md5 <- tools::md5sum(gff_file)</pre>
  if(gff_md5 != dwn_md5){
   warning("MD5 for downloaded feature table does not match expected MD5")
 }
}
## defining column types and names
gff_table <- read_tsv(gff_file, col_names = c("seqid", "source", "type", "start", "end",
                              "score", "strand", "phase", "attributes"),
                comment = "#")
## Parsed with column specification:
## cols(
##
     seqid = col_character(),
     source = col_character(),
##
##
    type = col_character(),
##
     start = col_double(),
##
     end = col_double(),
##
     score = col character(),
##
     strand = col_character(),
##
    phase = col character(),
##
     attributes = col_character()
## )
## Exon table with only RefSeq entries
exon_table <- gff_table %>%
  filter(type == "CDS",
         grepl("RefSeq", source)) %>%
```

```
rename(genomic_accession = seqid) %>%
  left_join(chrom_accn_df)
## Joining, by = "genomic_accession"
## Extracting CDS for chromosomes and converting to 3 column table.
exon table 3col <- exon table %>%
   filter(chromosome %in% c(1:22, "X", "Y", "MT"),
           seq_type %in% c("chromosome", "mitochondrion"),
           assembly_unit %in% c("Primary Assembly", "non-nuclear"))%>%
    select(chromosome, start, end) %>%
    ## Sorting table by chromosome and feature start position
    arrange(chromosome, start) %>%
   mutate(chrom = paste0("chr", chromosome)) %>%
    select(chrom, start, end) %>%
  distinct()
## Write to table as a bed file
tmp_bed <- tempfile(fileext = ".bed")</pre>
write_tsv(exon_table_3col, tmp_bed, col_names = FALSE)
```

4 Preparing Stratification Files

Generating bed file with merged overlapping CDS regions as well as notin bed. See mappability documentation for how GRCh38 genome bed file was generated.

```
merged bed file <- "GRCh37 refseq cds merged.bed"
system2("bedtools", args = c("merge", "-i", tmp_bed),
        stdout = merged_bed_file)
## Generating genome bed for subtractBed
faidx file <- "hs37d5.fa.gz.fai"</pre>
faidx_md5 <- "bb77e60e9a492fd0172e2b11e6c16afd"</pre>
genome_bed_file <- "human.hg19.chroms.only.genome.bed"</pre>
if (!file.exists(faidx_file)) {
  download.file(url = faidx_path, destfile = faidx_file)
  ## MD5 check
  dwn_md5 <- tools::md5sum(faidx_file)</pre>
  if(faidx md5 != dwn md5){
   warning("MD5 for downloaded feature table does not match expected MD5")
}
faidx_df <- read_tsv(faidx_file, col_names = c("CHROM", "SIZE", "X1", "X2", "X3")) %>%
  filter(CHROM %in% c(1:22,"X","Y")) %>%
  mutate(CHROM =pasteO("chr", CHROM)) %>%
  mutate(START = 1) %>%
  select(CHROM, START, SIZE)
```

```
## Parsed with column specification:
## cols(
##
     CHROM = col_character(),
     SIZE = col_double(),
##
##
    X1 = col_double(),
    X2 = col_double(),
##
##
    X3 = col double()
## )
write_tsv(faidx_df, path = genome_bed_file, col_names = FALSE)
## Generating not-in bed
notin_merged_bed_file <- "notin_GRCh37_refseq_cds_merged.bed"</pre>
system2("subtractBed", args = c("-a", genome_bed_file, "-b", merged_bed_file),
        stdout = notin_merged_bed_file)
## Compressing stratification beds
system2("bgzip", merged_bed_file)
system2("bgzip", notin_merged_bed_file)
```

5 File Sanity Checks

```
merged_bed <- read_tsv(paste0(merged_bed_file, ".gz"),</pre>
                        col_names = c("chrom", "start", "end"))
## Parsed with column specification:
## cols(
##
     chrom = col_character(),
##
     start = col_double(),
     end = col_double()
##
## )
total_cds <- sum(merged_bed$end - merged_bed$start)</pre>
notin_merged_bed <- read_tsv(paste0(notin_merged_bed_file, ".gz"),</pre>
                        col_names = c("chrom", "start", "end"))
## Parsed with column specification:
## cols(
##
     chrom = col_character(),
     start = col_double(),
##
     end = col_double()
notin_total_cds <- sum(notin_merged_bed$end - notin_merged_bed$start)</pre>
```

Number of bases in merged 33,980,656. Number of bases not-in merged 3,061,707,963. Total bases (in + not-in) 3,095,688,619.

6 System Information

```
s_info <- devtools::session_info()</pre>
